Abstract (en)

[origin: WO2020084064A1] The invention relates to a filter device comprising a capacitive component (C), a first inductive component (L1) and a second inductive component (L2), which can be connected in series with the capacitive component (C) and the first inductive component (L1). The capacitive component (C) is arranged between the first inductive component (L1) and the second inductive component (L2). The filter device also has a connection for connecting to the power grid. The first inductive component (L1) is arranged between the connection and the capacitive component (C). A switching device (SV) is designed to bypass the second inductive component (L2).
