Abstract (en)

The invention relates to a new equipment of water media rescue, facilitating the works for rescue and immobilisation of a multiple injured patient in an aquatic environment, such that the risk of worsening the injuries, specially in case of spinal cord injuries, is minimized. This equipment of water rescue, allows for the rescued person to be directly positioned on the spinal board from the beginning of the rescue operation, thus preventing the person from being transferred to a different board upon introduction in an ambulance at the end of the rescue. The rescue equipment of the invention includes the stretcher having the spinal board fixed thereto within the corresponding cavity. The spinal board fits flush within said cavity or recessed zone of the upper surface of the stretcher, the spinal board being coupled to the stretcher by the coupling means. A compact combination is rendered that the rescuer can normally use for rowing towards the place where the person to be rescued is located.
