Abstract (en)
[origin: EP3872352A1] Provided is an axial flow impeller including a central hub and multiple blades. The central hub includes a base plate and a stacking sidewall disposed at an edge of the base plate. Multiple first convex portions are disposed at a first edge of the stacking sidewall extending axially, and a first concave portion is disposed between every two adjacent first convex portions. Multiple second convex portions are disposed at a second edge of the stacking sidewall extending axially, and a second concave portion is disposed between every two adjacent second convex portions. The first convex portions are in one-to-one correspondence with the second concave portions in the axial direction, and the first concave portions are in one-to-one correspondence with the second convex portions in the axial direction. The blades are disposed along an external surface of the stacking sidewall, and an edge of each of the multiple blades connected to the stacking sidewall extends from an edge of one of the multiple first convex portions to an edge of an adjacent second convex portion.
