Abstract (en)

[origin: WO2020088788A1] The invention proposes a method by means of which portioned products which are pasty in the processing state are packaged in a wrapper which has been cut to length from a packaging-material web, wherein the packaging-material web is transported in the direction of an upwardly open pair of folding claws and is cut to length to form a planar blank of the wrapper, and the blank is positioned above the pair of folding claws, wherein the product is metered, the product portion is preformed and the blank is folded into the pair of folding claws by virtue of the preformed product portion being placed in position, the upwardly open wrapper being formed in the process. The upwardly projecting, lateral longitudinal peripheries of the wrapper are then folded over inwards onto the preformed product portion, whereupon the transverse peripheries of the wrapper, which extend perpendicularly to the longitudinal peripheries thereof, are folded over inwards onto the preformed product portion. The invention makes provision for at least the lateral longitudinal peripheries, preferably also the transverse peripheries, of the wrapper to be folded over inwards onto the preformed product portion, and connected to one another at the same time, while the wrapper provided with the preformed product portion is still located in the pair of folding claws. The invention also relates to a packaging machine which is suitable for implementing such a method.
