Abstract (en)

[origin: US2020148143A1] A method and apparatus is proposed for controlling the electrical connection and disconnection between a battery unit and a supercapacitor on an automobile with the objective of preventing the electrical connection between the battery unit and the supercapacitor from being exceedingly long that would otherwise cause degraded power supply performance or even damage to the battery unit due to the self-discharging property of the supercapacitor. This feature can help to improve the power supply performance and extends the battery life. The proposed method and apparatus is characterized by the steps that the supercapacitor is electrically connected to the battery unit only at a temporal point when there is a need to use the supercapacitor, and immediately disconnected from the supercapacitor whenever there is no more need to use the supercapacitor.
