Abstract (en)

A method of thermomechanically forming, for example forging, rolling, extruding or drawing, an article from a precursor thereof, is described. The method comprises: providing the precursor, for example an ingot, a forging stock, a forging, a bar, a billet or a plate, comprising, substantially comprising, essentially comprising and/or consisting of an $\alpha + \beta$ Ti alloy having a beta transus temperature β_{transus} , wherein the precursor defines a set of portions including a first portion; and thermomechanically forming the article from the precursor by heating the first portion and deforming the heated first portion by a total true strain $\epsilon_{1,\text{total}}$, wherein the total true strain $\epsilon_{1,\text{total}}$ is greater than a predetermined threshold true strain $\epsilon_{\text{threshold}}$; wherein thermomechanically forming the article from the precursor comprises i iterations of: (a) heating the first portion to a temperature T_i during a time t_i , wherein the temperature T_i is at most the beta transus temperature β_{transus} ; (b) deforming the heated first portion by a true strain $\epsilon_{1,i}$, wherein the true strain $\epsilon_{1,i}$ is at most the predetermined threshold true strain $\epsilon_{\text{threshold}}$; and (c) repeating steps (a) and (b) until the cumulative true strain $\epsilon_{1,\text{cumulative}} = \sum \epsilon_{1,i}$ is the total true strain $\epsilon_{1,\text{total}}$, wherein i is a natural number greater than or equal to 2.
