Abstract (en)

[origin: WO2020098859A1] The invention relates to a braking system (30) having a rotating element (5) that can be rotated about an axis (D), and a braking device (10) for braking the rotating element (5), wherein the braking device (10) has a first braking element (13) which can be moved between a rest position and a braking position and has an annular braking surface (13.1) which, in the rest position and in the braking position, is arranged concentrically with respect to the axis (D) of the rotating element (5), having a brake disc (34) which is co-rotationally connected to the rotating element (5) and which has a first frictional surface (34.1) and a second frictional surface (34.2) opposite the first frictional surface (34.1), wherein the annular braking surface (13.1) of the first braking element (13) is arranged at a distance from the brake disc (34) when in the rest position, and is in contact with the first frictional surface (34.1) of the brake disc (34) when in the braking position, and having a second braking element (35), which is arranged in such a way that in the braking position the first braking element (13) presses the brake disc (34) against the second braking element (35), such that, in the braking position, the second braking element (35) is in contact with the second frictional surface (34.2) of the brake disc (34).
