Abstract (en)  

[origin: WO2020102587A1] Technology is disclosed for a user equipment (UE) operable for collision resolution between UE-initiated signals and paging for a mobile terminated (MT) circuit switched (CS) service from a Third Generation Partnership Project (3GPP) network. The UE can be configured to initiate a UE-initiated procedure, wherein the UE initiated procedure is one or more of a tracking area update (TAU) procedure, an international mobile subscriber identity (IMSI) detach procedure, or a routing area update (RAU) procedure. The UE can be configured to decode a CS page procedure from a target base station (BS) before the UE-initiated procedure is completed, wherein the CS page procedure is one or more of a CS service notification or a CS page request. The UE can be configured to complete the UE-initiated procedure prior to responding to the CS page procedure.
