Abstract (en)

[origin: EP3881976A1] The invention discloses a movable handle attachable to shafts (1) comprising: an elongate body (2) configured to be grasped by the hand of a user and featuring an inferiorly open longitudinal orifice destined to house an upper portion of the shaft (1) whereto the handle is to be coupled; a tensioner (4) housed in the longitudinal orifice of the body (2), featuring an upper extremity resting against an upper portion of the longitudinal orifice; and an element (3) for the affixing of a lower extremity of the tensioner (4) to the shaft (1). Thus, when a user exerts a longitudinal downward force on the body (2) of the handle, the body (2) is displaced longitudinally downward and, consequently, the tensioner (4) housed in the orifice is compressed and exerts a longitudinal upward force which tends to return the body (2) to its initial superior position.
