Abstract (en)
[origin: EP3882174A1] The invention relates to a device enabled for carrying beverage cans, comprising a body of a laminar nature and with a symmetrical rectangular geometry, having on its surface at least one pair of incisions without mutual contact defining along their path a plurality of tabs with a folding or bending capacity in relation to the body itself, such that the proportions and the geometry of the incisions are suitable for the tight insertion into each pair of incisions of the upper base or mouth of a beverage can; the body furthermore has added cuts arranged transverse and perpendicular to an axis of symmetry of the same body and arranged between the pairs of incisions.
