Abstract (en)
[origin: WO2020104378A1] A lift car (1) has a balustrade (5), which is arranged on a roof (2) of the lift car (1), wherein the balustrade comprises posts (7, 8), which are fitted on a horizontal upper side (6) of the roof, and post-connecting crossmembers (9, 10). For each post, a docking element (15) is arranged on the upper side (6) of the roof, and the post (7, 8) is, or can be, docked on said docking element. The docking element (15) has form-fitting elements in the form of fingers (16) for accommodating the post in a form-fitting manner; the post (7, 8) has slots (17) or apertures (29), which are complementary to the fingers (16), the latter engaging in the slots (17) or apertures (29). The docking element (15) is a flattened component made up of two plates (18, 19) and is screwed to the roof (2). The balustrade (5) is secured by means of obliquely running supporting profiles (12, 13). (Fig. 1)
