Abstract (en)

The inventors discovered that in a sample from ARMS patients, the amounts of biopyrrin and cortisol significantly increase as well as the amounts of an immunoglobulin free κ chain (κFLC) and an immunoglobulin free λ chain (λFLC) significantly decrease. Therefore, the invention provides a biomarker for diagnosing ARMS comprising one or more selected from the group consisting of biopyrrin, cortisol, a κFLC or a fragment thereof, and a λFLC or a fragment thereof. By measuring the amount of the biomarker for diagnosing ARMS of the invention in a biological sample, ARMS diagnosis of a subject can be performed quickly, easily and accurately.
