Abstract (en)

[origin: WO2020114654A1] The invention relates to a device (10) for storing cards (18), having two retaining arms (14, 16) by means of which cards (18) which are to be pushed in are gripped on opposite sides of the cards (18), wherein a) the retaining arms (14, 16) are connected to one another via at least one surface-area portion (12), which extends between the retaining arms (14, 16), wherein the at least one surface-area portion (12) is configured such that it largely conceals the outwardly directed main surface area of a card (18) which has been fully pushed in, and the design of the device (10) allows elastic deflection of at least one retaining arm (14, 16), or b) the retaining arms (14, 16) are connected to one another via a connecting portion (12), which extends between the retaining arms (14, 16), wherein a shielding card (60) is accommodated by the connecting portion (12) and the retaining arms (14, 16) such that said shielding card (60) largely conceals the outwardly directed main surface area of a card (18) which has been fully pushed in, and the design of the device (10) allows elastic deflection of at least one retaining arm (14, 16).
