Abstract (en)
[origin: WO2020117803A1] A portable game platform including a first platform section and a second platform section pivotally joined together by a hinge. Each platform section formed of a base defining at least two holes and a surface board attached to the top of each base. A plurality of feet are configured to be removably received by the holes in the bases. The platform has a game play configuration in which the two surface boards form a continuous game play surface, and a collapsed configuration in which the game platform folds at the hinge and the bottom of the first base abuts the bottom of the second base. A process for setting up the portable game platform includes unfolding the platform sections along the hinge. Joining one of the plurality of feet into each of the holes defined in the bases, and leveling the game platform by adjusting the feet within the holes.
