Abstract (en)

[origin: WO2020115392A1] A deformable bracing rod is disclosed for holding a lower crossmember of a windshield opening of a motor vehicle. The deformable bracing rod (200) has rigid end portions (203, 204), respectively attached to the windshield opening lower crossmember (301) and to another element (102) of the body of the vehicle, and a flexible central portion (203) connecting the two rigid end portions. It makes it possible to design a collapsible lower crossmember of a windshield opening which yields in the event of an impact so as to damp the impact experienced by the head of a pedestrian, while maintaining the level of acoustic and vibrational performance.
