Abstract (en)

[origin: WO2021136690A1] The invention relates to a locking device, in particular an electric steering lock for a motor vehicle. The locking device comprises a locking element, which can be moved between a first and a second position, for locking a functionally-relevant component, such as the steering shaft in the steering wheel column, the gear shift lever, or the like, wherein the locking element is in blocking engagement with the component and/or can be brought into blocking engagement with the component in the first position and is not in engagement with the component in the second position. The locking element is acted upon in the direction of the first position by a spring, said spring being arranged in and/or on an elastic bellows.
