Abstract (en)
[origin: WO2020120541A1] The invention relates to an assembly (10) for a vehicle (1) for detecting an activation action for the activation of a function at the vehicle (1), in particular in a front, side and/or rear region (1.7, 1.4, 1.2) of the vehicle (1) for the activation of the opening and/or unlocking of a hinged closure element (1.3, 1.6) on the vehicle (1), comprising: at least one sensor element (20) for sensing a change, in particular an approach of an activating means (3), in the surroundings of the sensor element (20); a sensor monitoring assembly (170), which is electrically connected to the sensor element (20) in order to provide a sensor signal specific to a parameter of the sensor element (20), the parameter being specific to the sensed change in the surroundings and to a variable load portion; a storage assembly (250), the storage assembly (250) being electrically connected to the sensor monitoring assembly (170) in order to carry out a repeated determination of the parameter of the sensor element (20) by means of the sensor signal (20); a compensation assembly (230) for adjusting the sensor signal in order to compensate the load portion; a connecting assembly (220) for dynamically electrically connecting the storage assembly (250) to the adjusted sensor signal in the event of the repeated determination.
