Abstract (en)
[origin: CN113195244A] The invention relates to a tyre for a van and aims to improve the trade-off between rolling resistance and antagonistic performances such as the various types of grip (longitudinal/transversal, on dry/wet ground) and the wear. The tread (2) comprises raised elements (22) having a radial height H_s at least equal to 6.5 mm and at most equal to 11 mm, and having a volume groove ratio TEV at least equal to 18% and at most equal to 23%. The at least one elastomeric mixture of the tread (2) has a glass transition temperature T_g at least equal to -18 deg C and at most equal to -30 deg C, a Shore A hardness at least equal to 55 and at most equal to 66 and a dynamic loss $\tan \delta$ at 23 deg C at least equal to 0.15 and at most equal to 0.29. The tyre has also an intermediate layer of an elastomeric mixture having a dynamic loss $\tan \delta$ at 23 deg C at least equal to 0.05 and at most equal to 0.15, at most equal to the dynamic loss $\tan \delta$ of the materials of the tread.
