Abstract (en)

[origin: WO2020126483A1] A system for controlling an access to an access-restricted zone (22) in a building has a sliding door system (5) and a control device (8, 10) for the sliding door system (5). The sliding door system (5) has a door frame (2) and a sliding door (4) which can be displaced in the door frame (2) between a closed position and an open position by a drive unit (6) actuated by the control device (8, 10). The door frame (2) has a pass-through region (24) and a wall panelling region (18), which receives at least some of the sliding door (4) in the open position. The sliding door (4) has an end face (30), which in the open position points in the direction of the pass-through region (24). The control device (8, 10) has a processor unit (8) and a sensor unit (10), wherein the sensor unit (10) is arranged on the end face (30) of the sliding door (4), and the processor unit (8) is arranged in an interior and is electrically connected to the sensor unit (8) and the drive unit (6). The control device (8, 10) is designed to generate an alarm signal if a height (H), determined by the sensor unit (8), of an object (20) located in the pass-through region (24) deviates from a height range stored for said object (20).
