Abstract (en)
[origin: WO2020128602A1] Embodiments of a method in a wireless access node are disclosed. A method in an access node of a wireless network, the method comprises: transmitting a first Non-Zero Power (NZP) Channel State Information Reference Signal (CSI-RS) in a first set of resource elements of a subframe, the first NZP CSI-RS having a respective first number of ports; transmitting at least one second NZP CSI-RS in a second set of resource elements of the subframe, the second set of resource elements being a subset of the first set of resource elements, each second NZP CSI-RS having a respective second number of ports that is less than the first number of ports; and configuring at least one user equipment (UE) to perform rate matching using one or more Zero Power (ZP) CSI-RSs in a third set of resource elements of the subframe, the third set of resource elements overlapping the first set of resource elements and not overlapping the second set of resource elements.
