Abstract (en)
A clamp is provided, which has a simple structure capable of holding linear members of various sizes. The clamp includes a supporting member, a movable arm, and a fixed arm. The movable arm is swingably connected to the supporting member. The fixed arm has a base end portion fixed to the supporting member. The movable arm can swing between a closed position, where a tip end portion of the movable arm is adjacent to a tip end portion of the fixed arm, and an open position, where the tip end portion of the movable arm is placed farther from the tip end portion of the fixed arm. Both the movable arm and the fixed arm can elastically deform to displace their respective tip end portions relative to each other.
