Abstract (en)

[origin: WO2020144083A1] The invention relates to an ear support (1) designed to carry an electronic device (2) behind the auricle, comprising a leg with a central leg portion (9) substantially in the form of a hook for hooking onto the retro-auricular groove between the ear and the skull, and a first straight and rigid leg end (5) which extends from the central leg portion to form one leg end. The leg comprises a second elastically deformable and S-shaped leg end (10), the second leg end forming an extension of the central leg portion to form one leg end and extending obliquely relative to a plane (P) in which the central leg portion extends, and the second leg end and the central leg portion substantially form a helical leg section (PH) with each other.
