Abstract (en)

[origin: WO2021229158A1] - The device (1) for detecting the absence of a mechanical barrier for a missile (M) comprises a rod (5) constrained by a first elastic element (7) and provided with a free end (5a) capable of coming into contact with the mechanical barrier (2), a cam (8) constrained by a second elastic element (9), the rod (5) and the cam (8) being configured such that the rod (5) can assume one or more of the following positions: an initial entry position wherein the rod (5) is held in a stable position between the cam (8) and the mechanical barrier (2), an extended position wherein the rod (5) is moved by the cam (8) in the direction (E) of the free end (5a) in the absence of the mechanical barrier (2), and a final entry position wherein the rod (5) is acted upon by the first elastic element (7) after the rod (5) has been released by the cam (8) once the rod (5) has completely entered the missile (M) in said final entry position so as to no longer present a danger to its environment or a hindrance to the proper functioning of the missile (M).
