Abstract (en)
[origin: WO2020173701A1] The invention relates to a method for monitoring an industrial plant (100), to a computer program product, and to an industrial plant (100). The industrial plant (100) comprises two parts (100a, 100b). In a first part (100a) of the industrial plant (100), in particular a paper machine, first parameters (x_1, \dots, x_n) are provided. The industrial plant (100), particularly designed as a paper machine, is used to produce and/or process a fibrous material web (1). Second parameters (y_1, \dots, y_n) are provided in a second part (100b). The parameters ($x_1, \dots, x_n, y_1, \dots, y_n$) are stored, preferentially as time series (16a, ..., 16n, 17a, ..., 17n). In the case of a web break in the second part (100b), the second parameters (y_1, \dots, y_n) are first analyzed for a second anomaly. If no second anomaly can be detected, the first parameters (x_1, \dots, x_n) are analyzed for a first anomaly. During the analysis, the parameters ($x_1, \dots, x_n, y_1, \dots, y_n$) which were stored in a time range before the web break (F) are preferably examined. If a first or second anomaly is detected, these, and optionally measures to avoid such web breaks (F), are displayed to the user. Optionally, the first parameters x_1, \dots, x_n and/or the second parameters y_1, \dots, y_n can be set so as to avoid future web breaks F.
