Abstract (en)
[origin: EP3912493A1] [Problem] To prevent a reduction in usability accompanying a reduction in the residual quantity of power in a non-combustible-type flavor inhaler.[Solution] This aerosol generation control device in a non-combustible-type flavor inhaler has a power source, a control unit, and a wireless communication unit, the aerosol generation control device being such that when a parameter indicating the residual quantity of power in the power source satisfies a prescribed condition, prescribed information is transmitted via wireless communication to an external device. The device that has received the information provides a service such as matching with a user who has a power supplying device, thereby assisting the supply of power to the non-combustible-type flavor inhaler.
