Abstract (en)

[origin: CN113719212A] The invention relates to a locking and/or positioning drive device for a window, a door or the like. The locking and/or positioning drive device has a housing, a motorized drive unit which is arranged in the housing and has an associated transmission, and an output element which can be acted upon by the motorized drive unit with the associated transmission. In this case, the housing and the output element each have an elongated shape. The elongate driven element extends through the housing parallel to the longitudinal axis of the housing over the entire length of the housing. The output element can be driven in two longitudinal directions by means of the motorized drive unit having the associated transmission, and the two ends of the output element can be coupled to the tappet or tappet element in each case.
