Abstract (en)

[origin: WO2022200040A1] Disclosed is a system for managing collision avoidance of a first crane on a work site on which a second crane is located, the second crane being mobile, the system comprising: - a collision avoidance system of the first crane, configured so as to prevent a collision between the first crane and its environment; - a communication device configured to receive from the second crane an indication of the position of the second crane on the work site and to send to the second crane a confirmation of receipt of the indication of the position of the second crane on the site, when the indication of the position of the second crane corresponds to a distance, relative to the first crane, less than or equal to a first threshold value Z_c ; - a collision avoidance management module of the first crane, configured so as to activate the collision avoidance system of the first crane when the indication of the position of the second crane corresponds to a distance, relative to the first crane, less than or equal to a second threshold value Z_d less than the first threshold value Z_c .
