Abstract (en)
[origin: EP3916159A1] Structure (1) for supporting a telecommunications station (100), comprising a support base (2) that can be inserted inside an excavation made at the place where said station is installed, said base comprising a plurality of superimposed layers (3,4,5) in precast reinforced concrete, which are integrally and removably constrained to each other, said plurality of layers (3,4,5) defining one or more outer perimeter surfaces (7a, 7b, 7c, 7d) and an upper surface (8) to which said telecommunications station can be removably constrained, characterised in that said base (2) further comprises one or more side walls (6a, 6b, 6c, 6d) in precast reinforced concrete, which are removably constrained to each other and/or to said one or more outer perimeter surfaces (7a, 7b, 7c, 7d) of said plurality of layers (3,4,5) to prevent the vertical and/or horizontal relative creep between two or more layers of said plurality of layers and to provide a stiffness such as to counteract the strains borne by said telecommunications station. This base constitutes the foundation of a lattice, but the operating principle can also be applied to a telecommunications station with a pole for supporting the antennas.
