Abstract (en)
[origin: WO2020156756A1] The invention relates to a screening machine (5) having a vibrationally mounted machine frame which can be set into vibration and having screening elements (15, 25, 35) which are arranged in succession when viewed in the longitudinal direction of the screening machine, in or on the machine frame, and which are divided into a plurality of screening machine parts (1, 2, 3), which can be interconnected to form the screening machine (5) or can be assembled, and a single screening machine part (1; 2; 3) or one or more stacks (4) consisting of a plurality of screening machine parts (1, 2, 3) stacked one on top of the other have dimensions in length (L), width (W) and height (H) which are smaller than the corresponding dimensions of the interior of a conventional standard transport container (6) or than dimensions required as special transport due to being oversized.
