Abstract (en)

[origin: EP3919037A1] The present invention relates to crutches (1) that can be mated by magnetic means, consisting of conventional crutches (1) incorporating magnetic means (7,11) configured for occasionally attaching same to one another such that they remain in stable equilibrium by themselves and can be supported anywhere. The crutches are provided with a grip (2) having a cavity (6) at its end farthest away from the shaft (4), where a cylindrical diametric-type magnet (7) is housed, being able to move with complete freedom inside the mentioned cavity (6). The crutches (1) are provided with other magnets (11) which are placed at the ends of the forearm support (3), such that when the forearm supports (3) are perfectly coupled according to the plane of junction (10), the contact of the ends of the grips (2) also occurs.
