Abstract (en)
[origin: US2021380311A1] In a device (1) for holding objects (2) consisting of: a plate-shaped support frame (4) in which a plurality of accommodation openings (5) are incorporated, and a cage (6) suitable for accommodating the respective objects (2), which cage (6) has four side walls (71 to 74) extending perpendicular to one another and a base (8) arranged between them, the cage (6) should be able to be connected to the support frame (4) as quickly as possible and at the same time a reliable and permanent operative connection between the cage (6) and the support frame (4) should be achieved. This is made possible by the fact that an adapter (11) is provided between the support frame (4) and the cage (6), which adapter (11) has a holding pedestal (12) projecting in the direction of the support frame (4), the holding pedestal (12) can be inserted into one of the accommodation openings (5) of the support frame (4) and locked therein, and the adapter (11) is made up of four support arms (131, 132, 133, 134) which are perpendicular to one another and by means of which a rectangular inner space (14) is formed in which the cage (6) can be inserted and is fixed by at least two undercuts which are formed respectively between two pairs of side walls (71, 72, 73, 74) of the cage (6) and the support arms (131, 132, 133, 134) of the adapter (11).
