Abstract (en)

[origin: EP3919932A1] The present technology relates to a light receiving device and a distance measurement system that enable light to be surely received by a reference pixel. A light receiving device includes a plurality of pixels each including a light receiving element having a light receiving surface, and a light emission source provided on an opposite side of the light receiving surface with respect to the light receiving element. The plurality of pixels includes a first pixel including a light shielding member provided between the light receiving element and the light emission source, and a second pixel including a light guiding unit that is configured to propagate a photon and is provided between the light receiving element and the light emission source. The present technology can be applied to a distance measurement system or the like that detects a distance to a subject in a depth direction, for example, for example.
