Abstract (en)

A controller for controlling a DC-DC converter in a discontinuous conduction mode, DCM, the controller comprising: an output module configured to provide a switch control signal to the DC-DC converter, the switch control signal having an on-time and a switching frequency; an on-time-control-module configured to: receive a first compensation signal, wherein the first compensation signal is based on the output voltage of the DC-DC converter; and set the on-time of the switch control signal based on the first compensation signal; and a frequency-control-module configured to: receive a second compensation signal, wherein the second compensation signal is based on the output voltage of the DC-DC converter; and regulate the second compensation signal to a target range by setting the switching frequency of the switch control signal to one of a plurality of pre-defined discrete switching frequencies.
