Abstract (en)
[origin: EP3920554A1] This application provides a screen sounding device. A vibrator and a hard substance that has a specific Young's modulus and area size are disposed under a screen. The vibrator drives, by using the hard substance, the screen to vibrate in a direction perpendicular to a surface of the screen. Therefore, in a process in which the vibrator vibrates the screen by using the hard substance, a vibration area of the screen can be increased by using the hard substance, to enable, as much as possible, most regions of the screen to be vibrated, thereby generating a better vibration effect.
