Abstract (en)

[origin: WO2020165365A1] The invention provides the use of undifferentiated or dedifferentiated plant cells, whole and/or lysed, from Buddleja davidii Franch. obtained by an in vitro cell culture process, and/or an intracellular extract of said cells free of cellular debris, for a topical non-therapeutic cosmetic treatment to homogenize the complexion of the skin, in particular via prevention and/or treatment of pigment and/or skin texture heterogeneities. The treatment is particularly suitable for the treatment of skins of phototype III to V developing spots and areas of hyperpigmentation, and furthermore especially for the treatment of skin with olive carnation.
