Abstract (en)
[origin: WO2020165022A1] The invention relates to a device (1) for controlling the function of a vacuum lifting device, the device (1) having an in particular neck-shaped distributor block (2) with a first port (3) and a second port (4), a first flow duct (6) being formed in the distributor block (2) via which duct the first port (3) can be fluidically-connected to the second port (4) as required with the aid of a first valve means (12), a second flow duct (7) being formed in the distributor block (2) via which duct the first port (3) can be fluidically-connected to the external atmosphere (50) as required with the aid of a second valve means (13), and a third flow duct (8) being formed in the distributor block (2) via which duct the second port (4) can be fluidically-connected to the external atmosphere (50) as required with the aid of a third valve means (14).
