Abstract (en)

[origin: WO2020167238A1] A wireless device (14) is configured to receive control signaling (16) from a radio network node (12). The control signaling (16) configures an uplink grant or downlink assignment to periodically recur. The control signaling (16) also configures a number (K) of redundant transmissions of a transport block (22) that are transmittable within a bundle (18) of the configured uplink grant or downlink assignment, where the number (K) is greater than or equal to one. The control signaling (16) may also configure different sets of transmission occasions within which the number (K) of redundant transmissions are transmittable during, or starting during, a period (P) of the configured uplink grant or downlink assignment.
