Abstract (en)

[origin: WO2020169347A1] The invention relates to a device (1) for filling a container (2) with a carbonated liquid, comprising at least one top part (3) and one bottom part (4) which has a container connection (5) for fastening the container (2) to the device (1). The bottom part (4) can be moved, in a restricted manner, relative to the top part (3) between a closed position (23) and a venting position (6). When fastening the container (2) to the container connection (5), the bottom part (4) can be shifted into the closed position (23) by the container, and when detaching the container (2) from the container connection (5), the bottom part (4) can be shifted into the venting position (6) by the container (2), and therefore when the bottom part (4) is in the venting position (6), excess pressure in the container (2) can be reduced before the container (2) is detached from the container connection (5).
