Abstract (en)

A device (50) for determining an adjustment for a suspension component (25; 80) of a vehicle (100), which device comprises: a display (350); a memory (320) storing computer-executable instructions (325); and a processor (310), the arrangement being such that when executed by the processor (310), the computer-executable instructions (325) cause the device to: receive a weight value that indicates a load to be carried by the vehicle (100); determine a target pressure for an air spring of the suspension component (25; 80) based on the weight value; measure a loaded position of the suspension component (25; 80); and determine an adjustment to the suspension component (25; 80) based on the loaded position and the target pressure.
