Abstract (en)

[origin: WO2020177827A1] A system (10) for sheathing a building facade (B), the system (10) comprising a plurality of mounting rails (2,2') as well as a plurality of facade elements (1,1'); - wherein each mounting rail (2,2') comprises, viewed in cross section of the mounting rail's longitudinal direction, an abutment part (20), which is suitable for abutting against the building facade (B), as well as a first supporting protrusion (21) and a second supporting protrusion (22), wherein each supporting protrusion (21,22) further comprises an abutment surface (23,24); each facade element (1,1') comprises a first groove (12) and a second groove (13) arranged for retaining the facade element (1,1') relative to the mounting rail (2,2') and the building facade (B). The system is suitable for being mounted in a first configuration and a second configuration. In the first configuration, the facade elements are mounted, so that their outer surface extends substantially in the same plane when mounted on a plane building facade, such as a vertical outer wall or an inclining roof surface. In the second configuration, the facade elements are mounted to be imbricated, so that each of the facade element's outer surface forms an angle relative to a plane surface on the building facade.
