Abstract (en)
A heating cooker according to the present disclosure includes a housing, a heating unit, a door, and a gasket attached to the door. The gasket is made of an elastic material to provide sealing between the door in a closed state and a front face of the housing that faces the door. The gasket includes a fitting part fitted to an inner side of the door, and a first rising part and a second rising part that rise in a direction away from the door respectively from a first position and a second position of the fitting part that are spaced from each other. When the door closes, the second rising part is pressed by the front face of the housing to contact the first rising part.
