Abstract (en)
[origin: WO2020182726A1] The invention relates to a glass sliding door system (1), comprising at least one glass sliding element (10), which can be attached to a holding assembly (11) on a wall (12) of a building, wherein: the glass sliding element (10) is slidably held at the holding assembly (11) such that the glass sliding element (10) can be moved back and forth between an opening position next to a wall opening (13) formed in the wall (12) and a closing position in front of the wall opening (13); and the glass sliding element (10) is delimited by side edges (14) and at least one sealing element (15) is arranged on or in the region of the side edges (14). The at least one sealing element (15) particularly advantageously protrudes far from the glass sliding element toward the wall opening (13) in such a way that the at least one sealing element seals a gap (16) between the glass sliding element (10) and the wall (12) in the closing position.
