Abstract (en)

[origin: WO2020182339A1] The invention relates to a drive system comprising a converter, in particular an AC/DC converter, and an inverter for supplying power to an electric motor which is electrically connected to the AC voltage-side terminal of the inverter, wherein: the DC voltage-side terminal of the inverter is connected to the DC voltage-side terminal of the converter; a first means for detecting the voltage applied to the AC voltage-side terminal of the converter is connected to an input of a first analogue-to-digital converter of a signal electronics system by means of a first signal line; a second means for detecting a voltage, in particular a three-phase voltage, applied to a filter can be connected to an input of a second analogue-to-digital converter of the signal electronics system by means of a second signal line; the signal electronics system comprises an actuator for the semiconductor switch of the converter; the output of the first analogue-to-digital converter and the output of the second analogue-to-digital converter is connected to a comparison means of the signal electronics system; and a switching means of the signal electronics system adjusts the operating mode of the actuator of the semiconductor switches of the converter depending on the output signal of the comparison means.
