Abstract (en)
[origin: WO2020198213A1] A system of providing pain control includes a multi-lumen neuromodulation catheter having proximal end and a distal end. The catheter has a first lumen and a second lumen extending therethrough. The first lumen terminates near the distal end of the catheter and the second lumen terminates proximally at a point spaced from a distal end of the first lumen. The proximal end of at least one lumen includes a connector configured to electrically interconnect an electrode at the distal end of that lumen with an electrical pulse generator. At least one of the lumens is also configured to receive liquid medications.
