Abstract (en)

[origin: WO2020187556A1] The invention relates to a packaging system (1) for a multi-component product preparation process, having: - a first container (2) for storing a first product preparation component, - a second container (6) for storing at least one second product preparation component, and - a closure element (11) which seals off the first container (2) from the surroundings and has a coupling device in order to couple the second container (6) to the closure element (11) and in order to establish a fluidic connection between the first container (2) and the second container (6). The closure element (11) comprises a closure cap (17) which can be separated from the closure element (11) along a predetermined breaking point (18) in order to release the fluidic connection between the first container (2) and the second container (6), wherein the closure cap (17) is coupled to the second container (6) in a blocked manner in a rotational direction about an axis (L) of the closure element (11) and has a thread (15) with which the closure cap (17) can be connected to the first container (2) via a corresponding thread (5) of the first container (2).
