Abstract (en)
[origin: WO2020197449A1] Embodiments herein relate e.g. to a method performed by a first radio network node (12) for handling transmission of data in a wireless communication network. The first radio network node (12) determines a first load of the first radio network node (12), and obtains an indication of a second load of a second radio network node (13). The first radio network node further selects one or more transmission parameters for one or more beams based on the determined first load and the obtained indication of the second load. The first radio network node further performs a transmission of data to a wireless device (10) using the selected one or more transmission parameters and the one or more beams.
