Abstract (en)
[origin: WO2020197565A1] A refillable cosmetic compact (10) with a product base insert (14) repositionable in relation to a base structure (12) between an engaged configuration and a disengaged configuration. An actuation opening through the base structure (12) permits a pressing of a release button (30) of the product base insert (14) to induce the product base insert (14) from the engaged to the disengaged configuration. Resiliently deflectable catch members (40) project longitudinally from either or both of the base structure (12) and the product base insert (14). Converging deflection surfaces engage the catch members (40) as the product base insert (14) is repositioned from the disengaged configuration to the engaged configuration to deflect the catch members (40) laterally inwardly to retain a cosmetic pan (16) and to permit a deflection of the catch members (40) laterally outwardly as the product base insert (14) is repositioned from the engaged configuration to the disengaged configuration to release or receive a cosmetic pan (16).
