Abstract (en)
[origin: WO2020201397A1] The invention relates to a cutting device, comprising a frame (1), a cutting blade (3), which is fastened to the frame for pivoting about a first pivot axis (2), and a reduction transmission (4, 5), which converts each forward pivoting movement of a plurality of successively performed forward pivoting movements and backward pivoting movements of a drive arm (6) into a cutting pivoting movement of the cutting blade (3). In order to improve the ease of handling, a cutting-blade back-pivoting apparatus (20, 21, 22, 23) is provided, by means of which the cutting blade (3) can be pivoted back from a pivoting end position to an initial position. The back-pivoting apparatus has, in particular, a tension element (20), which acts on the cutting blade (3) in such a way that a clearance is formed.
