Abstract (en)

[origin: WO2020200618A1] The present invention relates to a closure-securing means (100) for a bottle (F), comprising: a first housing part (102) and a second housing part (104) which are designed to enclose non-detachably an upper section of the bottle neck (F1) of the bottle to be secured, including the bottle closure, when in a secure condition, the first housing part (102) and the second housing part (104) being connected to one another movably relative to one another and being shiftable between the secure condition and a released condition in which it is possible to detach the closure-securing means (100) from the bottle neck (F1); and a locking mechanism, which is assigned to either the first housing part (102) or the second housing part (104) and is designed to lock the first housing part (102) and the second housing part (104) in the secure condition. According to the invention, the locking mechanism (400) comprises a locking pin (402), which engages with both the first housing part (102) and the second housing part (104) in the secure condition to fix said parts in the relative alignment thereof, and which can be moved by means of an actuating element (406) out of engagement with at least one of the first housing part (102) and the second housing part (104) to allow the first housing part (102) and the second housing part (104) to be transferred into the release condition.
