Abstract (en)  
[origin: EP3952628A1] An analysis device is a device for use for a component mounting device including a pickup member configured to be moved relative to a board by means of a moving device and a contact detection sensor configured to detect that a component picked up by the pickup member is brought into contact with the board to analyze a mounting state of the component mounting device. The analysis device includes a storage device configured to store multiple detection result data relating to detection results obtained by the contact detection sensor when the component is mounted on the board in association with mounting conditions when the detection results are obtained by the contact detection sensor, and an output device configured to count the multiple detection result data stored in the storage device by at least two conditions in the mounting conditions and output the multiple detection result data so counted.
